

H-Tec Air Release and Vacuum Valves for Wastewater

Innovative Design

The large body prevents contamination by creating a large air gap. The beveled bottom allows debris to be quickly and easily flushed back into the force main. The debris shield prevents solids from contaminating the seal.

Non-Leaking

The valve will seal drip tight even at 0 psi pressure in the force main. Traditional ARV's require 3 PSI or more to seal resulting in a release of sewage.

Variable Air Discharge/Intake

The unique cup seal allows variable amounts of air in or out as needed by the application.

Easy Maintenance

H-Tec air valves are easy to assemble and disassemble. The working parts are removable through the top of the valve, and the cup seal is simple and easy to replace.

Corrosion Resistant Materials

H-Tec valves are designed to provide years of dependable service in corrosive environments. The internal components are stainless steel and high grade plastics, which will not corrode in wastewater applications. The body is available in epoxy coated steel, or stainless steel.

Light Weight

H-Tec valves weigh much less than traditional air release valves making installation and maintenance easier.

Readily Available Parts

Parts are in stock for quick shipment.
